Version History

[illegible]

1. Overview

This visual documentation case study demonstrates how complex technical information can be analyzed, structured, and translated into a purposeful visualization. It presents the context and source material behind the visualization, the communication problem it addresses, the intended audience, and the design decisions used to determine its scope, structure, and level of detail.

The case study includes the resulting visualization and identifies the source material used to understand and represent the subject.

2. Case Study Fields

Each case study follows a consistent structure to document the context, communication need, intended audience, visualization approach, and supporting references behind the resulting visual solution.

Table 1 Case Study Fields

Source Field	Description
Source & Context	What information or system was studied and where the visualization originated
Communication Problem	What aspect of the information is difficult to understand or needs clarification
Audience	Who the visualization is intended to help
Design Decisions	Why a particular diagram type, scope, structure, and level of detail were selected
Visualization	The resulting visual solution
Source Material	The authoritative references used to understand and verify the subject

2.1. Source & Context

This visualization is based on **GitHub's documented GitHub Actions and GitHub Pages workflow model**. GitHub Actions can automate build and deployment processes in response to repository events, while GitHub Pages can publish static site output produced by a workflow.

2.2. Communication Problem

Documentation authors working with Docs-as-Code may understand that a repository change eventually appears on a published website without clearly understanding the automated stages between source content and deployment. The visualization explains that technical processing pipeline at a conceptual level.

2.3. Audience

Documentation specialists, technical writers, and new contributors learning a Docs-as-Code publishing workflow.

2.4. Design Decisions

A **Technical Process Flow** was selected to show how documentation source is transformed and moved through an automated build and deployment pipeline. The visualization emphasizes the **progression of documentation and generated artifacts** through systems, processing stages, and changes in state, while the connections describe the **actions and transformations** that move the documentation toward the published site.

To maintain focus on the primary build and deployment process, the visualization intentionally omits:

- Detailed GitHub Actions workflow configuration
- Individual build commands and dependencies
- Authentication and permission configuration
- Error handling and failed deployment scenarios
- Other implementation details not required to understand the primary documentation pipeline

2.5. Visualization
